Figure S6: Impact of clodronate treatment
C57Bl6 animals were immunised with Ag in IFA with CpG and treated with liposomes containing either PBS or clodronate. 2 days after immunisation, the expression of CD11b and CD64 at the surface of CD11c+ cells in the draining LN was estimated (A) or 9 days after immunisation, monocyte depletion was assessed in the blood of animals (B) (n≥4/group, mean ± SEM).
