

Supplementary Figure S11. Concordance of the comparisons regarding ambulation status based on all or only age-matched patients. Boxplots represent the six concordant protein profiles significantly differing between ambulant and non-ambulant DMD patients independent of age interval of the patients included in the analysis. Violet and orange boxes represent non-ambulant and ambulant UNEW DMD patients, respectively. For each sample

group, the box-and-whisker plot represents signal intensities within lower and upper quartile (box), the median (horizontal line within box), percentiles of 5% and 95% (whiskers) and outliers (dots).
